

Hand Truck Converted to Workstand

Description

A Washington State manufacturer of fiberglass bathtub and shower units modified hand trucks used to move the units from the automatic production line to the grinding room. By adding a "kick stand" to the hand trucks, they can now use them as workstands to raise the units up to a good height for the grinding work. Use of the modified hand trucks has reduced neck and back bending for workers in the grinding room.

The hand truck is used to move the tub, then the whole thing is lowered toward the floor, the "kick stand" then swings out and can be locked into place. This raises the bottom of the tub or shower enclosure to about knee high for the grinding work, which is done with hand grinders.
